Find a FONT

Les Earnest

Abstract

Typefaces currently available for the Xerox Graphics Printer are presented herein, warts and all. Procedures for creating, modifying and stealing fonts are discussed.

Apology

This note attempts to describe the public fonts available at the Stanford A. I. Lab. *as they are.* In a number of cases they *should* be quite different. Unfortunately, it has not been possible to allocate sufficient resources to tidy things up. Documentation facilities are an interesting sideline, but not our main business. For the most part, we are dependent on volunteers, both here and elsewhere, for the generation and improvement of fonts.

"Here is the whole set! a character dead at every word."
The School for Scandal — Richard Sheridan

"Give ample room, and verge enough, The characters of hell to trace."
The Bard — Thomas Gray

"I'll publish, right or wrong: Fools are my theme, let satire be my song."
English Bards and Scotch Reviewers — Lord Byron

"Publish and be damned." — Duke of Wellington

"'Tis from high life high characters are drawn."
Moral Essays — Alexander Pope

"I feel a little bored; Will some one take me to a Pub?"
Ballade of an Anti-Puritan — Gilbert Chesterton

I. INTRODUCTION

This note describes symbol sets available for our Xerox Graphics Printer. Each symbol is defined by a rectangular bit array, with 1 and 0 representing "black" and "white". [The basic representation should be quite different, but that is another story.]

A font file generally contains a collection of characters of a certain size and style. The standard font files in our system have ".FNT" extensions and are stored in [XGP,SYS]. Most programs that deal with font files default to these values. Users may create and use their own font files. The internal structure of these files, which need not concern the casual user, is described in Appendix C.

Font Dissemination Policy

We have no objection to other University research groups copying our font files. Most other groups in the research community appear to have similar policies. Appendix D is a guide to font theft via the ARPAnet.

Commercial organizations wishing to use our fonts will be expected to pay a licensing fee (negotiable). Only fonts that were created in our laboratory will be considered for licensing by us.

(In)Compatibility

In exchanging documentation files with other organizations, there are a number of potential difficulties. For example, the SAIL character set uses a number of ASCII control codes to represent exotic symbols, to the endless pain of other groups who try to use our software. Appendix B itemizes differences between our code and others.

Not only do character codes vary, but so do XGP adjustments: CMU makes their resolution about 183 pixels/inch; PARC and ISI use 192; we and MIT-AI use 200. Overall, one must worry about differences in

symbol sets, character codes, documentation languages, font files, and XGP resolutions. [Sigh.] Perhaps we will get it together next time.

Programs that use Font Files

Users may write programs that output directly to the XGP as described in the UUO Manual [1]. A more common approach is to prepare a text file for processing by a document compiler, which writes a file containing XGP commands that is XSPOOLed [2].

There are two document compilers currently in use here: Pub [3] and Pox [4]. Pox is substantially faster than Pub and offers somewhat greater freedom in positioning text, but has a rather messy syntax and an incredible array of possible states. Pub has an ALGOL-like syntax and better facilities for dealing with arbitrary source text formats, but is large (50k+ in pass 1) and slow. Neither is the ultimate document compiler.

While the use of multiple fonts can improve the readability of documents, it also imposes a computing load both in compiling and printing. To minimize the system costs, please observe the following rules.
1. Don't declare more fonts than you use.
2. Whenever possible, avoid the use of the larger fonts except in small documents.

For example, if you want to use SIGN57 on the cover and title page of a sizable document, you should compile and print those pages by themselves. For A. I. Memos, there is a Pub macro available that makes covers and title pages [5].

Because of stringent timing requirements in printing on the XGP, the font files are not used directly, but are first "compiled" into a data structure that is well suited to XGP output. The timesharing system takes care of this automatically.

If your document uses too many fonts (requiring more than 65k words of font

storage or more than one minute of elapsed time to compile any one font), the printing task will automatically abort. The latter restriction can often be circumvented by precompiling a font [6]. Compiled font files normally have ".CFT" extensions.

If you suspect that the document compiler of your choice has run amok, use XGPTYP to convert the XGP file into readable commands so that you can see what happened. Say "R XGPTYP" to the Monitor, then "?" for operating instructions.

Font Manipulation Programs

To examine any given font on a Data Disk terminal, say "R DDFONT" and give the font name (e.g., "NGR25").

To generate a sample of any particular font on the XGP, give the command
     R FCOPY;<font name>/SAMPLE
FCOPY can also be used to convert fonts stolen from outside organizations to our font file format, to make fonts fixed width, or to rotate them [7].

To create a new font, use TVFONT [8]. TVFONT can also stretch existing fonts (after polygon conversion) or slant them.

To modify an existing font, use EDFONT [9]. It allows you to draw, rotate, and mirror image fonts up to 40 pixels high. To combine selected characters from two fonts, use EDFONT or COMBIN [10]. If you forget all this, say "HELP FONT" to the system.

If you want to examine or modify font parameters or permute characters and you don't mind living dangerously, use FONT [11].

Please be careful in modifying public fonts. Cleaning up ragged characters is generally OK, but permuting or replacing characters may introduce bugs in existing documents. It is safer to introduce a new font with the improved character arrangement, declare the old one "obsolescent", and eventually delete it.

2. FONT DESCRIPTIONS

This catalog takes a forthright stand against some forms of evil, but compromises with others. *Ad hoc* substitutions in certain character positions are treated as a "missing symbols" and the symbols that are there currently are not identified. The purpose is to permit these fonts to be corrected. *If you use ad hoc symbols, you do so at your own risk. Some day they will be replaced by the correct symbols for that font.*

This catalog ignores characters that are "hidden" under control codes such as CR, LF, and ALT. While both Pub. and Pox provide facilities for printing these things, it is all a silly business. If one hides alternate characters under CR, for example, why not put them under each letter of the alphabet? Since hidden characters are basically a bad idea, they are not reported below.

While a number of fonts in this catalog are rather ragged or silly, some are too bad for even our loose standards, or have been superseded. Appendix A is a Blacklist of such fonts, with the reason given for each rejection. The expectation is that these fonts will be deleted eventually.

Organization and Terminology

Fonts are organized below on the following basis:
  (1) symbol class (variable width regular, fixed width regular, special symbols),
  (2) typeface (e.g. "Baskerville"),
  (3) size (smallest to largest),
  (4) style (e.g. light, italic, or bold).

The traditional printer's units are the *pica* (1/6 inch) and *point* (1/72 inch). Font heights are given below both in points and in *pixels* (picture cells, i.e. XGP raster units). The "points" height includes an assumed interline spacing of 3 pixels, which is the default value in Pub. The default interline spacing in POX is 0 in simulator mode and 4 pixels in non-simulator mode.

The notation "height = 25 pixels = 20 + 5" means that the font is 25 pixels high, not counting any interline spacing, with 20 above the baseline and 5 below. The *maximum width* is also given in pixels. For a diagram of these parameters and others used to define fonts, see Appendix C.

Pixel to Point Conversion

Our XGP is adjusted to about 200 pixels/inch, which means that $\mathbf{1}$ "point" is about 2.8 pixels. If you need to make a master that will photographically reduce to a font of a certain size (in points), here is a table of font heights (in XGP pixels) that should be used for various reduction ratios, assuming an interline spacing of 3 pixels.

	Magnification					
Result	x1	x0.9	x0.8	x0.7	x0.6	x0.5
(points)	Font Height (pixels)					
6	13	15	17	20	24	30
8	19	21	24	28	34	41
10	24	27	31	36	43	52
12	30	34	38	44	52	63
14	35	40	45	52	61	74
18	47	52	59	68	80	97
24	63	71	80	92	108	130
30	80	89	101	116	135	163
36	97	108	122	139	163	197
42	113	126	142	163	191	230
48	130	145	163	187	219	263
60	163	182	205	235	274	330
72	197	219	247	282	330	397

The name of the originator of each font is given below where known. In some cases we have guessed, perhaps inaccurately. Corrections are solicited. For fonts that originated outside SAIL we generally have no information about the originator(s) so we simply indentify the probable originating organization, e.g. CMU (Carnegie-Mellon University AI group), MIT (M.I.T. AI group), or ISI (Information Sciences Institute, University of Southern California) or the SHY Corporation.

In describing character sets, we use "SAIL set" to mean the peculiar character set that we use, as described in Appendix B. The "ASCII set" is taken (inacurately) to mean those characters in the SAIL set with codes greater than '40, while the "special characters" are SAIL symbols with character codes less than '40.

For fonts with nonstandard characters in some positions, we use the notation "$\alpha \rightarrow \beta$" to mean that the code that normally prints as "α" prints as symbol "β" in this font. In fonts where senseless substitutions have been made, they are not listed.

3. VARIABLE WIDTH REGULAR FONTS

Baskerville

The Baskerville fonts include lightface, *italic*, and bold. The "BAS" fonts include ligatures in place of certain special characters, as noted below. The ligatures and some additional special characters are also available in BAXS30 (see Section 5, Miscellaneous fonts). If you are using Pub and want ligatures, use BASK.PUB [SUB,SYS] to make the substitutions automatically.

For special accents, use the zero-width font ZERO30. There are some supplementary Baskerville symbols in BAXS30.

If time be of all things the most precious,
wasting time must be, as Poor Richard says, the
greatest prodigality; since, as he elsewhere tells
us, lost time is never found again; and what we
call time enough, always proves little enough:
Let us then up and be doing, and doing to the
purpose; so by diligence shall we do more with
less perplexity.

Coronet

CORON   18 point Coronet Bold (height = 48 pixels = 37 + 11, width ≤ 51)   by Stan Kugell
             A cursive set of letters, digits, and a little punctuation. Rather uneven.

ABCDE FGHIJ KLMNO PQRST UVWXYZ abcde fghij klmno pqrst uvwxyz 01234 56789 ; : , .

Little Bo Peep has lost her sheep, and cant tell where to find them;
Leave them alone and theyll come home, and bring their tails behind them.
Little Bo Peep fell fast asleep, And dreamt she heard them bleating;
But when she awoke, she found it a joke, For they were still a fleeting.

Countdown

CNT57   22 point Countdown (height = 57 pixels = 50 + 7, width ≤ 68)   by Paul Martin
             Upper case letters only.

Seals

STA200   79 point Old Stanford Seal (height = 216 pixels = 108 + 108, width = 216)   by Tovar

S→
STAN2   79 point Newer Stanford Seal (height = 216 pixels = 108 + 108, width = 225)   by Tovar

S→
Displaced

Here are some fonts that have been displaced from their normal positions. Since Pub and Pox have facilities for displacing any fonts up or down, these displaced fonts are not strictly necessary.

SUP   9 point Superscript (height = 21 pixels = 28 + -7, width ≤ 20)   by Tovar
            Made by displacing NGR20 upward.
ABCDE FGHIJ KLMNO PQRST UVWXYZ abcde fghij klmno pqrst uvwxyz 01234 56789 ↓ ∝ β ∧ ¬ ∈ π λ ∞ ∂ ⊂ ⊃ ∩ ∪ ∀ ∃ ⊗ ↔ _ → ~ ≠ ≤
≥ ≡ ∨ ! " # $ % & ' ( ) * + , - . / : ; < = > ? @ [\ ] ↑ ← ' { | }

Example using NGR25 for main text: $E = M C^2$ (Einstein was a square M.C.)

SUB   ·   9 point Subscript (height = 21 pixels = 9 + 12, width ≤ 20)   by Tovar
            · Made by displacing NGR20 downward.
ABCDE FGHIJ KLMNO PQRST UVWXYZ abcde fghij klmno pqrst uvwxyz 01234 56789 ↓ ∝ β ∧ ¬ ∈ π λ ∞ ∂ ⊂ ⊃ ∩ ∪ ∀ ∃ ⊗ ↔ _ → ~ ≠ ≤
≥ ≡ ∨ ! " # $ % & ' ( ) * + , - . / : ; < = > ? @ [\ ] ↑ ← ' { | }

Example using NGR25 for main text: H_2O is tasteless; H_2SO_4 is tangy.

Tengwar

Here are tengwar (Elvish characters) from Tolkien's "Lord of the Rings". For a discussion of composition techniques, see TENGWR.DON [UP,DOC].

TNG40 15 point Tengwar (height = 40 pixels = 32 + 8, width ≤ 33) by Bob Currier @ISI
Modified by Don Woods.

(Tengwar character set sample)

(Tengwar text sample, six lines)

TNG75 28 point Tengwar (height = 75 pixels = 50 + 25, width ≤ 72) by Don Woods
A larger set.

(Tengwar character set sample)

(Tengwar text sample, six lines)

TNG112   41 point Tengwar (height = 112 pixels = 75 + 37, width ≤ 92)   by Don Woods
The largest.

APPENDIX A

Blacklist

The following fonts are not included in the preceding catalog for the reasons given here. They should be fixed or deleted.

Font	Reason
BDJ22	Too ragged in many places.
BDJ28	Too ragged in many places.
FORN25	Identical to FIX25 except that the accents ` ' ~ have zero width, so that they overwrite the following character. ZERO30 has an equivalent set of accents and is more complete.
KBD25	Keyboard is identical to FIX25 except for "` ' ~", which are made to look more like they do on keyboards, which is a difference of little utility.
LG25	Appears to be identical to GACB25.
LGI25	Despite its name, this italic doesn't match either LG25 or LGR25. GACI25 is better.
LGR25	Substantially the same as GACB25.
MISC25	Superseded by the more complete MS25 and ZERO30.
MISC30	Superseded by the more complete MS30 and ZERO30.
PLT11	This teeny font is unreadable.
PLT11R	So is its rotated cousin.
PLUNK	Superseded by the more complete MATH30 and MS25.
SUPSUP	Super-superscript font is unnecessary. Pub and Pox provide better ways of dealing with vertical displacements.
SUBSUP	Sub-superscript is unnecessary for the same reason.
SUBSUB	Sub-superscript is similarly unnecessary.

APPENDIX B

Character Codes

Here is the Stanford A. I. Lab. (SAIL) Character Set and corresponding octal codes.

	0	1	2	3	4	5	6	7
000	NUL	↓	α	β	∧	¬	ε	π
010	λ	HT	LF	VT	FF	CR	∞	∂
020	⊂	⊃	∩	∪	∀	∃	⊗	↔
030	_	→	~	≠	≤	≥	≡	∨
040	SP	!	"	#	$	%	&	'
050	(	)	*	+	,	-	.	/
060	0	1	2	3	4	5	6	7
070	8	9	:	;	<	=	>	?
100	@	A	B	C	D	E	F	G
110	H	I	J	K	L	M	N	O
120	P	Q	R	S	T	U	V	W
130	X	Y	Z	[	\	]	↑	←
140	`	a	b	c	d	e	f	g
150	h	i	j	k	l	m	n	o
160	p	q	r	s	t	u	v	w
170	x	y	z	{	|	ESC	}	BS

Here is a list of octal code differences between the SAIL character set, the ASCII set upon which it was based, and the CMU and MIT sets, which was based on both. A blank entry in a given row means that symbol has no representation in the given character set.

In ASCII, all symbols from '0 through '37 are control characters whereas we use many of these codes for graphical symbols. The following list of differences between principal XGP users.

Symbol	SAIL	CMU & ISI	MIT	ASCII	
λ	'10				
VT	'13	'13		'13	Vertical tab
_	'30	'30	'137	'137	
~	'32	'32	'176	'176	
≠	'33	'33	'32		
↑	'136	'136	'13		
←	'137	'137	'30		
ESC	'175	'176	'33	'33	Escape (Altmode)
}	'176	'175	'175	'175	
BS	'177	'177, '10	'10	'10	Backspace
ε			'136	'136	
DEL			'177	'177	Delete

APPENDIX C

Font File Format

A font file is a collection of up to 128 glyphs, usually representing a character set in some typeface. Parameters defining size and relative placement of a glyph are diagrammed below.

**Figure C-1. Glyph Parameters**

The *baseline* is the distance from the logical top of the glyph to the imaginary line on which the row of glyphs rests (though they may extend below this line). All glyphs in a given font file have the same height and baseline.

The format of font files is given below, based on 36 bit words. All distances are measured in pixels, which for our XGP are .005 inch.

WORDS '0-'177: XWD CHARACTER_WIDTH, CHARACTER_ADDRESS

The first 128 words of the file contain pointers in the right half to the word number where the corresponding characters definition begins. The left half of each word contains the character width (i.e. the logical width).

WORDS '200-'237:

'200	CHARACTER SET NUMBER	[unused by us]
'201	HEIGHT	Overall height of font (pixels).
'202	MAX WIDTH	Width of widest character (seldom used).
'203	BASELINE	Logical height above the baseline.
'204	COLUMN POSITION ADJUSTMENT	[Obsolete–should be left at 0]
'205	FONT CHARACTERISTICS	Reserved for future use
'206-'237		Reserved for future use.

WORDS 240-377: ASCIZ /FONT DESCRIPTION/

This text field of up to 480 characters should contain the full name of the font, who made it or where it came from, and possibly how it was created.

REMAINDER OF FILE

The remainder of the file consists of glyph definitions pointed to by the right halves of words '0-'177. Each glyph has the following format, using the FAIL Byte instruction.

BYTE (9) RASTER_WIDTH, CHARACTER_CODE (18) WORD_COUNT+2

WORD_COUNT+2 is total space devoted to this definition. If RASTER_WIDTH is 0, then use CHARACTER_WIDTH (above). RASTER_WIDTH is the physical width of the glyph, while CHARACTER_WIDTH is the amount the column counter is advanced after printing this glyph. This allows glyph to space more or less than their actual width.

BYTE (9) LEFT_KERN, ROWS_FROM_TOP (18) DATA_ROW_COUNT

LEFT_KERN is the amount by which the glyph overlaps the preceding character. Note that the right kern is not specified, since its value is implied by the other width parameters (LEFT_KERN, CHARACTER_WIDTH, and RASTER_WIDTH).

ROWS_FROM_TOP is the number of blank rows between the logical top and the top of the bit raster. This avoids having to store rows of zeros for glyphs that do not extend all the way to the top. DATA_ROW_COUNT is the number of rows in the bit raster, which need not extend to the logical bottom.

BLOCK WORD_COUNT

The balance of the glyph definition is the bit raster, with "0" representing "white" and "1" representing "black". If the CHARACTER_WIDTH is 36 or less, then the data are packed into words such that an ILDB gets the next scan line. Otherwise, each scan line starts at first available word boundary.

APPENDIX D

Other Places, Other Names

Stealing fonts is a lot like stealing jewels. To do it successfully, you have to know where to look and be able to recognize what you find. This appendix lists some of the classier joints on the ARPAnet and the names they use for fonts we have already, to aid in recognizing new fonts. If you are interested in questions of morality, see the "Font Dissemination Policy" in Section I.

Font swiping is complicated by name changes. Some font file collections have been totally renamed so that they are "more orderly" in some sense. In order to use an imported font, you must convert it to our font file format (Appendix C). This process is complicated by the fact that there are currently something over 10 different font file formats in use at just four sites that we know of. FCOPY "knows" how to convert the standard MIT and CMU formats and generally does the right thing, but you may need some help from our non-resident expert, Tovar (TVR @SU-AI).

CMU

The AI group at Carnegie-Mellon University was the first to implement an XGP system and did much of the pioneering work in creating fonts. Lee Erman (Erman @CMUB) is a good contact.

The CMU font files are located in area [A730KS00] @CMUB. They generally use the same file names that we do, except that their extension is ".KST". To convert to SAIL format, use FCOPY with the /CMU switch.

MIT

The MIT AI group has been quite active both in creating and stealing fonts. Tom Knight (TK @MIT-AI) usually knows what is happening.

The MIT fonts are in areas FONTS and FONTS1 @MIT-AI and have ".KST" extensions. Alas, they use a different naming convention, of the form
    <height><width><type>.KST
where the *height* is in XGP pixels, the *width* is a single letter ("F" or "V", denoting fixed or variable), and the *type* is a 1 to 3 letter descriptor, with G or R for Gothic (sans serif) or Roman (serif) and L, I, or B for light, italic, or bold respectively. For example, our NGB25 is called 25VGB there. "Special" fonts fonts are marked with an "S" prefix. There is recent evidence that this tight little scheme is falling apart.

Known correspondences with our font names are listed below. To convert to our format, use FCOPY with the /MIT switch.

ISI

Pete Alfvin (ALFVIN @ISIA) is a contact at ISI. Their fonts are in directory <FONTS> @ISIx (where x = A, B, C, ...) and have ".XH" extensions. Alas, they too have succombed to the renaming fad and use font names of the form
    <type><height><modification>.XH

where *type* is generally the same as ours (e.g. "NGB" for News Gothic Bold), the *height* is in "points" (1/72 inch), and the *modification*, if given, may be "B" for boldface, "I" for italic, or "L" for lightface.

The ISI font file format is described in <XGP-DOC> FONTS.DOC @ISIB and <XGP-DOC> FONTS.FILEFORMAT @ISIB. It is supposedly identical to MIT's font format, with the exception of the "byte count" field (see their documentation file). To convert, try FCOPY with the /MIT switch. Who knows, it might work.

<div align="center">Cross Index</div>

Here is a list of all SAIL fonts, in alphabetical order, together with corresponding CMU, MIT and ISI names. Blanks mean no corresponding file is known. The correspondence is not exact in all cases.
